Overview

The SCT52250 is a dual-channel non-invertible high-speed low side driver with supporting up to 24V wide supply for both power MOSFET and IGBT. Each channel can source and sink 5A peak current along with the minimum propagation delay 12ns from input to output. The 1ns delay matching and the stackable output characteristics

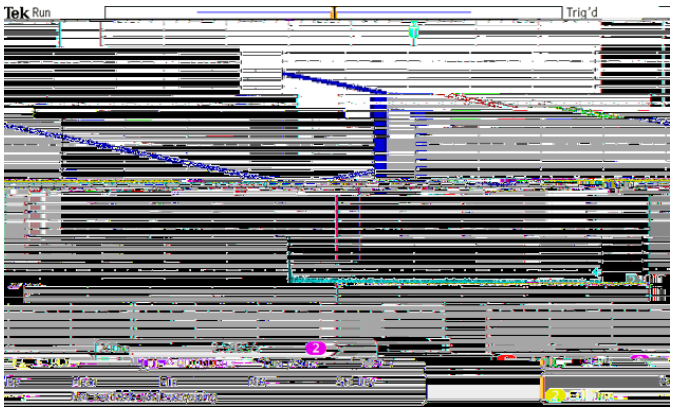

Figure 15. Driver Switching OFF

Thermal Shutdown

Once the junction temperature in the SCT52250 exceeds 162 C, the thermal sensing circuit stops switching until the junction temperature falling below 137 C, and the device restarts. Thermal shutdown prevents the damage on device during excessive heat and power dissipation condition.

Typical Application

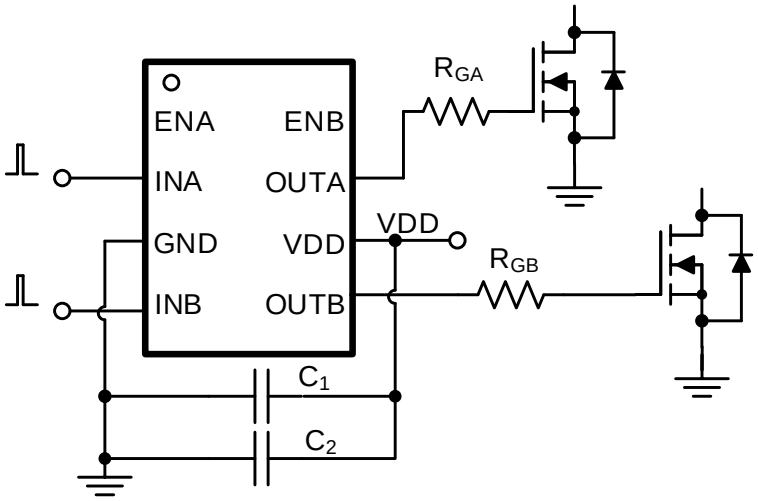

Figure 16. Dual Channel Driver Typical Application

Driver Power Dissipation

Generally, the power dissipated in the SCT52250 depends on the gate charge required of the power device (Qg), switching frequency, and use of external gate resistors. The SCT52250 features very low quiescent /Spbtrents and internal logic to eliminate any shoot-through in the output driver stage, their effect on the power dissipation within the gate driver is negligible.

For the pure capacitive load, the power loss of each channel in SCT52250 is:

(1)

Where

- V_{DD} is supply voltage
- C_{Load} is the output capacitance
- F_{SW} is the switching frequency

For the the switching load of power MOSFET, the power loss of each channel in the SCT52250 is shown in equation (2), where charging a capacitor is determined by using the equivalence $Q_g = C_{LOAD}V_{DD}$. The gate charge includes the effects of the input capacitance plus the added charge needed to swing the drain voltage of the power device as it switches between the ON and OFF states. Manufacturers provide specifications that provide the typical and maximum gate charge, in nC, to switch the device under specified conditions.

(2)

Where

- Q_g is the gate charge of the power device
- f_{SW} is the switching frequency
- V_{DD} is the supply voltage

If R_G applied between driver and gate of power device to slow down the power device transition, the power dissipation of the driver shows as below:

(3)

Where

- R_{OH} is the equivalent pull up resistance of SCT52250
- R_{OL} is the pull down resistance of SCT52250
- R_G is the gate resistance between driver output and gate of power device.
